## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Software-defined networking (SDN) encompasses different types of network technology that are aimed at making the network as flexible and agile as the virtualized server of the modern data center. The primary goal of SDN is to allow engineers and network administrators to respond effectively to changing business requirements. In such a network, the network administrator can control traffic from a centralized control console without having to touch individual switches. Functional separation, automation through programmability, and network virtualization are the key technologies covered under SDN.
