The software verification practice confirms the consistency among elements of the software architecture. This implies the determination that the software design, as expressed by the architecture, has been properly formulated and configured to satisfy stakeholder needs. Software verification and validation practices are sometimes confused with testing and quality assurance. However, within the software engineering discipline, software verification involve assessments of the software architecture to determine its fitness to transition to the software implementation stage of development. The software architecture must be continually verified to be internally consistent and validated against stakeholder needs. Software verification must substantiate that the software design will fulfill its intended purpose and, consequently, justifies further investment in the development project.
