A soil sampling device is a specialized tool used to obtain soil samples at different depths underground. It extracts soil from the strata without damaging its original structure through rotary drilling or percussion sampling. The device typically consists of a drill rod, sampling drill bit, extension rod, handle, and sample collection tube, and can perform functions such as stratified sampling, fixed-depth sampling, and undisturbed sampling. Based on the power source, it can be divided into manual and mechanical types, and is widely used in agricultural soil surveys, geological exploration, environmental monitoring, and engineering surveys, providing accurate samples and data for soil physicochemical property analysis and foundation research.Sales in 2024 will be 360,000 units, with an average price of US$52 per unit.The single-line production capacity is 80,000 units, with a gross profit margin of 60%.

United States market for Soil Drilling Sampling Device is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
