Soil Electrical Conductivity Sensor is an instrument used to measure the electrical conductivity of soil. It reflects soil salinity by measuring the conductivity of soluble salt ions in soil. Soil electrical conductivity is an important parameter for evaluating soil quality, crop growth and irrigation water quality. The Soil Electrical Conductivity Sensor works by inserting two or more electrodes into the soil and calculating the conductivity of the soil by measuring the conductivity value between the electrodes. The sensor is generally made of conductive materials such as silver chloride or platinum, which has the advantages of high measurement accuracy and good stability. Soil Electrical Conductivity Sensor has a wide range of applications, including agriculture, environmental monitoring, geological exploration and other fields. In agriculture, soil conductivity sensors can be used to monitor soil salinity, guide irrigation and fertilization, and improve crop yield and quality. In environmental monitoring, soil conductivity sensors can be used to monitor soil pollution and evaluate soil remediation effects. In geological exploration, soil conductivity sensors can be used to detect underground water sources, mineral resources and so on.

The global Soil Electrical Conductivity(EC) Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
