Soil enzymes are central to ecosystem processes because they catalyze innumerable reactions in soils that have biogeochemical significance. Catalytic soil enzymes can exist internally or on surface membranes of viable cells, be excreted into soil solution, or be complexed in the soil matrix or microbial debris. Extracellular enzymes may play an ecologic role for some microbial community members by hydrolyzing substrates that are too large or insoluble for direct absorption by microbial cells. More than 100 enzymes have been characterized in soils. With the exception of dehydrogenase and possibly a few other enzymes, which only exist in viable cells, nearly all other enzymes exist in both viable and complexed forms, independent of viable cells, stabilized in the soil matrix.
