Soil Heat Flow Meter is an instrument used to measure the rate of heat transfer in the soil, and is commonly used in agricultural, meteorological and ecological research. It accurately calculates the heat flux density per unit area by sensing the temperature gradient and thermal conductivity in the soil, thereby evaluating processes such as surface energy balance, crop growth environment or soil respiration. The transmitter is usually buried below the surface and has real-time monitoring and data output functions, which facilitates long-term observation and system integration.

United States market for Soil Heat Flow Meter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
