The soil respiration measurement system is a scientific instrument used to measure the carbon dioxide emissions produced by the metabolic activities of microorganisms, plant roots and other biological tissues in the soil. This process is called soil respiration and is a key process in soil ecosystems. The soil respiration measurement system evaluates the decomposition of organic matter and microbial respiration activity in the soil by monitoring changes in carbon dioxide concentration in the soil. Typically, soil respiration measurement systems include the following major components: carbon dioxide sensors, soil sample collection tools, data loggers, and computer software.

The global Soil Respiration Measurement System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
