A soil sampling drill is a type of drilling equipment used to collect soil samples from the ground. It consists of a drill bit attached to a long metal rod, which is rotated by a motor to bore into the soil. As the drill bit penetrates the soil, it collects a cylindrical sample of soil inside a hollow tube called a 'core barrel'. The core barrel is then extracted from the ground and the soil sample is removed for analysis.

Soil sampling drills are commonly used in geotechnical engineering, environmental studies, and agricultural research. They are used to collect soil samples for testing and analysis to determine soil properties, composition, and contamination levels.
