Soil Vapor Extraction (SVE) is a common soil and groundwater contamination remediation technology used to treat volatile organic compounds and other contaminants in soil. The system works by creating a vacuum in contaminated soil, causing volatile organic compounds in the soil to evaporate into a gaseous state, and extracting these pollutant vapors through an extraction well or network of extraction wells. These extracted vapors are typically sent to treatment systems to convert pollutants into forms that are not environmentally hazardous.

Soil Vapor Extraction (SVE) Systems are usually suitable for situations where the groundwater level is shallow, the soil has good permeability, and pollutants are easily volatile. They are often used to treat volatile contaminants such as light petroleum hydrocarbons, solvents and other volatile organic compounds. However, for some contaminants, especially for difficult-to-volatile contaminants or contaminants in deep soil, SVE may have limited effectiveness, and at this time it may be necessary to combine other remediation technologies to achieve complete contaminant removal.

The global Soil Vapor Extraction (SVE) Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
