Solar Array Drive Assemblies, or SADAs, are an integration of mechanical and electrical components used for rotating the solar panels on the satellite. The mechanical actuator drive system of the SADA rotates the solar arrays based on sun tracking information, while the electrical component of the SADA provides a pathway for power transfer from the arrays to the satellite. A SADA mainly consists of Solar Array Drive Mechanism (SADM) and Solar Array Drive Electronics (SADE). A SADA is used to position the solar

arrays towards the sun (or in another required direction) and transfer the generated power from solar panels to the satellite bus. For this function, SADA utilizes a combination of onboard computer/electronics (which is a part of the SADE) and motors as well as actuators (which is a part of the SADM). The SADM forms the complete mechanical structure of SADA helping the spacecraft to achieve flexibility to rotate and position the solar arrays as per the mission requirements. On the other hand, the SADE ensures the smooth commanding of these mechanical components. Optimal positioning of the solar arrays with respect to the position of the sun maximizes the acquired sunlight and increases the power output for the same given area of the panel – so potentiometers are used for position feedback. SADAs can also help reduce the mass and size requirements of solar arrays significantly.
