Abstracts

The global Solar Component Cleaning Chemical market size is predicted to grow from US\$ 434 million in 2025 to US\$ 626 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2025, global solar component cleaning chemical production reached approximately 48 kilotons, the average price is 9300 usd/ton. Solar component cleaning chemicals are specifically designed to remove dirt from photovoltaic module surfaces to restore its power generation efficiency. Its core function is to quickly dissolve or strip pollutants while ensuring that it does not cause corrosion or damage to glass cover plates, antireflection coatings and frame materials. Such chemicals are mainly divided into acidic, alkaline and neutral cleaning agents according to their pH values. Acidic cleaning agents are often used to remove inorganic salt deposits such as metal oxides and scale. Alkaline cleaning agents have a good effect on organic stains and oils, while neutral cleaning agents have become the mainstream choice due to their low corrosivity and high safety. In addition, many products also add surfactants to enhance wetting and penetration capabilities, and contain corrosion inhibitors and other ingredients to protect component materials. Their use requires specific dilution ratios and operating specifications, and environmental requirements need to be considered to promote the market towards biodegradable, low environmental impact green formulations.

Market Concentration and Key Players:

From an international perspective, the market concentration of solar module cleaning chemicals is relatively high, mainly concentrated in developed countries in Europe and America. For example, large manufacturers such as AR BlueClean and K?rcher; from a domestic perspective, there is still a lot of room for development of solar module

cleaning chemicals.

Manufacturing Processes and **Market Trends:**

The core of the manufacturing process of solar module cleaning chemicals lies in the precise compounding and mixing of specific functional components. The typical process begins with the formulation design according to the target dirt type, selecting and weighing alkali, acid, surfactant, chelating agent and deionized water, and then enters the stepwise dissolution and mixing stage. For example, organic acid is dissolved in water to obtain solution A, and then alkali and part of surfactant are dissolved in water to obtain solution B or C. Finally, the solutions are mixed homogeneously with stirring to form the final product, and more advanced formulations incorporate semiconductor photocatalysts (such as titanium dioxide) to achieve photocatalytic self-cleaning functions, or are prepared into self-responsive microcapsule formulations to release the active ingredient when the component temperature reaches a threshold.

The current global solar panel cleaning chemicals market is showing steady growth. The market expansion is mainly driven by the continued growth of global photovoltaic installed capacity and the rigid demand for power generation efficiency maintenance. The trend of technological evolution is clear, and products are accelerating in the direction of environmental protection, efficiency and intelligence. Bio-based cleaners have become an important growth point due to their environmentally friendly characteristics. At the same time, new formulations with self-cleaning, no-rinse, low-foaming or photocatalytic degradation functions are constantly emerging. In order to meet the demand for automatic cleaning and water consumption reduction of large photovoltaic power plants, China, North America and Europe are the main markets in terms of regional pattern, and they compete for market share by providing differentiated and high-performance solutions.
