The global Solar Control Interlayer Film market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The solar control Film greatly cuts not only ultraviolet rays but also infrared rays, which irritate the skin, by scattering solar control particles throughout the regular film layers using a unique particle scattering technology that evenly distributes particles and materials with various functions throughout the interlayer film resin.

Interlayer films are polymer-based materials used primarily in the production of laminated glass products. These films are inserted between layers of glass to enhance the safety, strength, and functionality of the glass. The global market for interlayer films is influenced by factors such as advancements in technology, changing consumer preferences, and evolving safety regulations. The demand for safety and security features in architectural and automotive glass continues to drive the market for interlayer films. These films are used to create impact-resistant and shatterproof laminated glass, making them suitable for applications in buildings, vehicles, and more. Automotive manufacturers are increasingly adopting interlayer films for use in vehicle glazing. Laminated glass with interlayer films enhances passenger safety, reduces noise, and offers UV protection. In the construction industry, interlayer films are used to create energy-efficient and sound-insulating windows. These films can also add decorative or aesthetic elements to architectural glass. Interlayer films with solar control properties are in demand for applications where the control of heat and UV radiation is essential, such as in buildings and vehicles. These films contribute to energy efficiency and occupant comfort.
