The global Solar Polycrystalline Silicon Ingot Casting Furnace market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

The solar industry is the primary driver for the polysilicon market, as polysilicon is a crucial component in the manufacturing of photovoltaic cells. The growing deployment of solar power generation systems worldwide has led to an increased demand for polysilicon ingot casting furnaces.

To meet the growing demand for polysilicon, many manufacturers are expanding their production capacities. This includes the installation of additional polysilicon ingot casting furnaces to increase the output of high-quality polysilicon ingots.

Energy consumption is a significant consideration in polysilicon production. The industry is focusing on developing more energy-efficient ingot casting furnaces to reduce operational costs and environmental impact.

Polysilicon ingot quality is crucial for the efficiency and performance of solar cells. Manufacturers are investing in research and development to improve the quality of ingots produced by casting furnaces, aiming for lower impurity levels and better crystalline structures.

The polycrystalline silicon ingot casting furnace is one of the key equipment for polycrystalline silicon manufacturing. The stability of its process flow, the stability and

advancement of equipment control are directly related to whether it can produce qualified silicon ingots, and qualified silicon ingots directly determine the silicon wafers.
