The global Solar Traffic Lights market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Solar traffic lights are traffic control devices that use solar photovoltaic cells to convert sunlight into electricity, which is then stored in batteries for powering traffic signals. Unlike traditional traffic lights that rely on mains electricity, solar traffic lights can operate independently, making them particularly useful in locations that don't have access to electricity. Solar traffic lights work by absorbing sunlight through the photovoltaic cells located on top of the signal head. These cells convert sunlight into electricity, which is then stored in batteries located beneath the signal head. The batteries have enough capacity to power the lights for several consecutive days, even in the absence of sunlight.

United States market for Solar Traffic Lights is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
