A Solder Mask Exposure Machine is a specialized piece of equipment used in the printed circuit board (PCB) manufacturing process. Its primary function is to expose the solder mask layer, which is a protective layer applied onto PCBs, to UV light or other forms of radiation, in order to create openings where components will be soldered. The solder mask layer is typically a photosensitive material that covers the copper traces on a PCB. When the PCB with the uncured solder mask is placed in the solder mask exposure machine, a photomask or stencil (also known as artwork) is positioned above it. This mask has cutouts that correspond to the areas where the solder pads and component leads should be exposed.

The global Solder Mask Exposure Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
