## Abstracts

The global Solder and Metal-based Thermal Interface Material (TIM) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Solder and metal-based thermal interface materials are materials used during the joining or thermal contact of metal components and differ in their properties and applications. Solder thermal interface material is a material used to join two or more metal parts together. It is usually a fusible alloy that is heated to melt and come into contact with the surface of the metal parts, and then forms a strong bond during cooling. Metal-based thermal interface materials are materials used to improve heat conduction between metal components. They have high thermal conductivity and can be placed between the contact surfaces of metal components to fill uneven and tiny gaps, thereby improving heat conduction efficiency.

Solder and metal-based thermal interface materials can be used to join metal parts to improve thermal conductivity and transfer heat from one metal part to another. When selecting and applying these materials, analysis and evaluation should be carried out based on specific engineering needs and conditions to ensure that the appropriate material is selected to meet the required connection strength or thermal conductivity performance.
