The global Solid Amorphous Metal Materials market size is predicted to grow from US\$ 663 million in 2025 to US\$ 990 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Amorphous alloys, also known as metallic glasses, are a type of alloy that lacks a long-range ordered crystal structure. They are typically formed by rapid cooling of a molten metal, which prevents the atoms from arranging themselves into a crystalline lattice. This results in a material with unique properties, including high strength, high corrosion resistance, and excellent magnetic properties.

Amorphous metal materials have excellent mechanical properties, chemical stability, magnetic and electrical conductivity, and thus have broad prospects for application in many fields. Here are some trends and directions for the future development of amorphous metal materials:

Development of new materials: In order to meet the needs of different fields, it is necessary to develop amorphous metal materials with different characteristics, such as high strength, high electrical conductivity, high magnetic permeability, etc.

Industrial production: Although amorphous metal materials have been studied for many years, their production still faces many challenges, such as high cost and low yield. Therefore, future research should focus on improving the production efficiency and reducing the cost of amorphous metal materials.

Application in new fields: Amorphous metal materials have been successfully applied in many fields, such as aerospace, electronics, and energy. However, there is still great

potential for their application in new fields, such as biomedicine, robotics, and high-temperature applications.
