The global Solid CVD SiC Focus Rings market size is predicted to grow from US\$ 320 million in 2025 to US\$ 810 million in 2032; it is expected to grow at a CAGR of 14.2% from 2026 to 2032.

Solid CVD SiC Focus Ring is a high-purity monolithic semiconductor part manufactured through chemical vapor deposition, featuring fully dense, binder-free silicon carbide structure. It is specially engineered for wafer plasma processes, serving to confine plasma range, protect wafer edge areas, and improve process uniformity with outstanding high-temperature stability, plasma erosion resistance and chemical inertness in harsh semiconductor manufacturing environments.

In 2025, global Solid CVD SiC Focus Rings production reached approximately 488 K Pcs, with an average global market price of around US\$ 670 per Pc. The production capacity of Solid CVD SiC Focus Rings is approximately 617 K Pcs per year, the average gross profit margin was 31-33%.

The upstream chain mainly supplies high-purity silicon and carbon precursors, special electronic-grade process gases, and high-end CVD reaction equipment, alongside ultra-precision machining and testing consumables; midstream manufacturers complete core procedures including CVD deposition forming, precision cutting, lapping, polishing and ultra-clean purification to produce finished solid SiC focus rings; downstream demands come from semiconductor fabs and wafer foundries, widely matched with etching, thin-film deposition and other front-end chip manufacturing processes.

The cost composition is mainly occupied by high-purity special raw materials and electronic-grade process gases, followed by high-cost CVD deposition manufacturing,

ultra-precision precision machining and cleanroom production expenses; strict semiconductor-level quality testing, high-standard surface treatment, vacuum packaging and low-temperature logistics also take up a certain share, and product yield and processing accuracy are key factors affecting comprehensive production costs.
