The global Solid Diffusion Source market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A solid-state diffusion source is a material used in semiconductor manufacturing to diffuse impurity elements from the solid state into the interior of a semiconductor crystal at a specific temperature to change its electrical properties. Through heating, the impurity atoms in the diffusion source gradually enter the surface of the semiconductor material, penetrate into the crystal structure, and form a doping layer. This method is often used in the doping process of semiconductor materials such as silicon wafers to regulate the conductivity and other properties of the device. Solid-state diffusion sources are stable, uniform, and easy to control, and are a commonly used doping method in the semiconductor production process.

United States market for Solid Diffusion Source is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
