The solid-liquid purge trap is a pretreatment device used to analyze volatile and semi-volatile organic compounds in solid or liquid samples. It 'purges' the target compounds from the sample matrix by passing an inert gas (such as nitrogen or helium) into the sample, and then captures them in a cryogenic cold trap or adsorbent. The trapping device is then quickly heated to desorb these compounds and allow them to enter analytical instruments such as gas chromatography (GC) or gas chromatography-mass spectrometry (GC-MS) for qualitative and quantitative analysis. This technology can significantly improve detection sensitivity and reduce sample matrix interference, and is widely used in the detection of trace organic pollutants in environmental monitoring, food safety, chemical industry and other fields.
