Solid Lubricating Bearing use metal materials as the base, and form an ordered and appropriately-sized hole on the base, and then embed oil-containing graphite or molybdenum disulfide particles as the solid lubricant. When the bearing works under oil-free lubrication conditions, due to the effect of frictional heat, the solid lubricating material will gradually transfer to the working surface of the friction pair, thereby reducing the coefficient of friction.

The global Solid Lubricating Bearing market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
