## Abstracts

The global Solid Magnesium Methanol market size is predicted to grow from US\$ 43.08 million in 2025 to US\$ 59.92 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Magnesium methoxide, as a metal alkoxide, is a water sensitive solid compound with a wide range of applications. Magnesium methoxide can be used as a deacidification agent, especially in organic solution deacidification methods. Its alkalinity can neutralize the acids in the paper. At the same time, the remaining magnesium methoxide on the paper hydrolyzes into magnesium hydroxide under the action of water vapor, which reacts with air to form magnesium carbonate, giving the paper an acid resistant buffering effect. However, the melting effect of methanol on certain colored handwriting and ballpoint pen handwriting, as well as its high alkalinity, limit its use in certain specific applications. In addition, magnesium methoxide also plays an important role in the field of organic synthesis. It is a selective substrate used as a neutralizing agent in anhydrous systems and is also the main raw material for preparing high-purity magnesium oxide. Magnesium methoxide is often used as a catalyst in organic synthesis reactions, especially in the synthesis research of ketoxime compounds. Its demand has rapidly increased with the development of hydrometallurgy processes and the increase in demand for metallurgical reagents, demonstrating good application prospects. ?

Solid magnesium methoxide refers to magnesium methoxide delivered in solid form such as powder or particles, often appearing as a white powder with a content of not less than 98% and a content of not less than 99%. In 2025, global Solid Magnesium Methanol production reached approximately 2,387 MT, with an average global market price of around US\$ 18.45 per kg.

The annual production capacity of solid magnesium methanol is 3,500 tons, with a gross profit margin of about 25%.

The upstream mainly comes from the basic chemical and non-ferrous metal chains, with key raw materials including high-purity magnesium ingots or magnesium powder, anhydrous methanol, auxiliary materials and supporting materials including activation aids and process aids that suppress side reactions, inert gases such as nitrogen or argon, desiccants and dehydration system consumables, solvent recovery systems, filtration media and moisture-proof lining packaging materials. At the same time, it relies heavily on corrosion-resistant reaction vessels, closed filtration drying and explosion-proof facilities.

Downstream, it is mainly used as an alkaline reagent or methoxylation reagent in organic synthesis and fine chemicals, such as condensation and ester exchange reactions in the synthesis of pharmaceutical and pesticide intermediates, transesterification catalysis in the manufacture of special esters and additives, and as a magnesium source or precursor in some materials and catalytic systems. Its customers are mostly pharmaceutical and chemical plants, agrochemical enterprises, fine chemical plants, and reagents and distribution channels with anhydrous inert operation capabilities.

The cost of raw materials usually accounts for 55% to 75% of the total cost, manufacturing expenses account for about 10% to 18%, packaging and hazardous chemical logistics account for about 6% to 15%, quality inspection and document system and manual management account for about 6% to 12%, and environmental safety compliance and loss disposal account for about 3% to 8%.
