The global Solid-Phase Supports for Oligo Synthesis market size is predicted to grow from US\$ 159 million in 2025 to US\$ 225 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

Solid-phase supports for oligo synthesis are insoluble, functionalized support materials used in solid-phase oligonucleotide synthesis, primarily including controlled pore glass and polymer-based supports such as polystyrene. They are typically designed with specific particle size, pore size, and loading parameters to enable stepwise oligonucleotide chain assembly through phosphoramidite chemistry. These materials play an important role in synthesis efficiency, impurity control, cleavage and deprotection compatibility, and final oligonucleotide quality. Upstream raw materials mainly include high-purity silica or glass substrates, polystyrene and related crosslinked resins, linkers and universal supports, surface functionalization reagents, solvents, and other fine chemicals. Downstream customers mainly include oligonucleotide API and intermediate manufacturers, nucleic acid drug developers and producers, DNA and RNA synthesis service providers, diagnostic reagent companies, and research institutes and academic laboratories. Based on ex-factory pricing, the global production capacity of solid-phase supports for oligo synthesis in 2025 is estimated at approximately 8,700 kilograms, with sales of about 7,184 kilograms, an average ex-factory price of approximately USD 22.6 per gram, and gross margins typically ranging from 38% to 58%, with high-specification and modified supports contributing the majority of profits. Overall, this is a small but technically demanding market characterized by high value-added, small-batch, and multi-specification products, and it is continuing to shift from traditional glass-based supports toward highly functional polymer supports and universal linker systems.
