The global Solid Polyaluminum Chloride market size is predicted to grow from US$ 465 million in 2025 to US$ 643 million in 2031; it is expected to grow at a CAGR of 5.6% from 2025 to 2031.

Polyaluminum Chloride, abbreviated as PAC. Commonly known as basic aluminum chloride or coagulant, it is a water-soluble inorganic polymer between ALCL3 and AL (OH) 3, with a chemical formula of [AL2 (OH) NCL6-NLm], where m represents the degree of polymerization and n represents the neutrality of PAC products. The color is yellow or light yellow, dark brown, dark gray resin like solid. This product has strong bridging and adsorption properties, and during the hydrolysis process, physical and chemical processes such as coagulation, adsorption, and precipitation occur. The fundamental difference between polyaluminum chloride and traditional inorganic coagulants is that traditional inorganic coagulants are low molecular weight crystalline salts, while polyaluminum chloride's structure is composed of multi carboxyl complex compounds with diverse forms. It has a fast flocculation and precipitation rate, a wide range of applicable pH values, and is non corrosive to pipeline equipment. Its water purification effect is obvious, and it can effectively support the removal of color SS, COD, BOD, arsenic, mercury and other heavy metal ions in water. This product is widely used in drinking water, industrial water and sewage treatment fields.

United States market for Solid Polyaluminum Chloride is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Solid Polyaluminum Chloride is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
