The global Solid Rocket Motor Throat Liner market size is predicted to grow from US$ 56.62 million in 2025 to US$ 89.25 million in 2032; it is expected to grow at a CAGR of 6.8% from 2026 to 2032.

A solid rocket motor throat liner is the thermal and erosion-resistant lining inside the nozzle throat (the narrowest section), designed to withstand and stabilize the intense thermal loads and erosive effects caused by the passage of high-temperature, high-velocity combustion gases. At the same time, it helps control the throat geometry and flow characteristics to maintain chamber pressure and exhaust flow, thereby ensuring stable thrust and engine safety. Throat liners are typically made from ablative materials or high-temperature composites (such as carbon–carbon composites, graphite-based refractory materials, ceramics, or modified ablatives). Their design requires balancing heat and erosion resistance, mechanical strength, chemical compatibility with propellants, as well as weight and cost considerations. A well-designed throat liner not only extends nozzle life and reduces performance degradation but also directly influences thrust efficiency and operational safety of the motor. In 2024, global solid rocket motor throat liner sales volume reached approximately 6,012 units , with an average global market price of around k US$ 9.03 per unit. The main raw materials of throat liner cover C/C compsites and tungsten-copper alloy.
