The global Solid-State Battery Precursor market size is predicted to grow from US$ 13.92 million in 2025 to US$ 123 million in 2032; it is expected to grow at a CAGR of 37.3% from 2026 to 2032.

Solid-state battery precursors are the materials used in preparing the solid electrolytes and electrodes for solid-state batteries. These precursors are key to enhancing energy density, safety, and longevity in these next-generation batteries.

Solid-state battery precursors refer to key materials used to prepare solid-state batteries. These materials undergo chemical reactions or physical changes during the manufacturing process of the battery and eventually form the active substances of the battery. Solid-state batteries are a battery technology that uses solid electrolytes instead of traditional liquid electrolytes, with advantages such as higher energy density, better safety and longer cycle life.

Many companies and research institutions around the world are increasing their investment in the research and development of solid-state batteries, including Toyota, Volkswagen, BMW, CATL, Samsung SDI, etc.

Some companies have begun small-scale production and pilot applications of solid-state batteries, and more commercial products are expected to be launched in the next few years.

Governments of various countries are also actively promoting the development of new energy technologies, providing financial support and policy incentives to promote the industrialization of solid-state battery technology.
