The global Solid State Relays and Isolators market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Solid State Relays (SSRs) and Solid State Isolators (SSIs) are two related electronic components that play an important role in circuit design, especially when electrical isolation and control of high-power signals are required. A solid-state relay is a contactless electronic switching device that uses semiconductor devices such as transistors, MOSFETs, IGBTs, etc. to achieve isolation between input and output and control the switching of loads. Solid-state relays provide electrical isolation, ensuring safe operation between control circuits and load circuits while avoiding wear and bounce issues of mechanical contacts. Solid-state isolators are semiconductor devices that provide electrical isolation between input and output. They are often used to protect low-voltage control circuits from high-voltage faults. Solid-state isolators can be designed to control loads in excess of 1000V and 100A. They use coreless transformer technology to transfer energy to drive power transistors such as MOSFETs or IGBTs. The choice of solid-state relays and solid-state isolators depends on the specific application requirements, including the required voltage and current levels, the type of control signal, the isolation requirements, and whether specific protection functions are required. These components provide flexibility in design, allowing engineers to select the appropriate solid-state relay or isolator for specific application needs.

United States market for Solid State Relays and Isolators is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
