The global Solid Waste Management Service market size is predicted to grow from US\$ 2076 million in 2025 to US\$ 4739 million in 2032; it is expected to grow at a CAGR of 12.8% from 2026 to 2032.

Solid waste management services encompass the entire process of collecting, sorting, transporting, treating, and disposing of various types of solid waste (such as municipal solid waste, industrial waste, construction waste, and medical waste). The aim is to reduce the environmental and human health hazards of waste while simultaneously achieving resource recycling and reuse, thus promoting sustainable development. Downstream applications of solid waste management services primarily cover municipal solid waste treatment, industrial waste and hazardous waste disposal, construction waste management, sludge treatment, and landfill closure and remediation. Clients include government departments, industrial enterprises, construction companies, and environmental project contractors. Due to the high technical requirements and the potential for resource-based value-added services (such as incineration power generation and recycling), professional management companies typically achieve a gross profit margin of around 32%, with resource recovery and high-value-added disposal services tending to have even higher profit margins.

Solid waste management services, as an important component of the environmental protection industry, are not only related to the improvement of urban ecological environment and public health and safety, but also closely linked to sustainable industrial development. With increasingly stringent environmental policies, accelerated urbanization, and increased industrial waste generation, the demand for professional and technology-driven solid waste management services continues to rise. At the same time, resource recovery and value-added utilization have become key directions for the

industry's profitability and sustainable development.
