Solid waste refers to solid, semi-solid and gaseous articles, substances, and laws and administrative regulations that have lost their original use value or have not lost their use value but are abandoned or abandoned in production, life, and other activities. The articles and substances regulated to be included in the management of solid waste mainly include household garbage, industrial solid waste and hazardous waste. The pollution isolation system can establish an effective barrier between solid waste and the ecological environment, and is widely used in the pollution isolation of solid wastes such as household garbage, general industrial solid waste, and hazardous waste. The pollution isolation system can realize the two-way isolation of pollutants, and temporarily store solid wastes that cannot be comprehensively utilized for the time being. At the same time, it prevents the accumulation of leachate and landfill gas, and regulates the biodegradation process of organic matter. The ecological environment restoration business can achieve functions such as blocking and sealing pollutants, improving the environment of the landfill area, repairing contaminated soil, and restoring the value of land use.

According to this study, the global Solid Waste Pollution Barrier Repair market size will reach US\$ million by 2029.
