The solvent preparation degasser is a solvent degassing and pretreatment device specially used in liquid chromatography, mass spectrometry analysis and precision chemical experiments. It is designed to efficiently remove dissolved gases (such as oxygen, nitrogen and carbon dioxide) in the solvent to improve the accuracy of experimental data and the operating stability of the system. The device usually integrates heating, vacuum pumping or membrane separation technology. Through constant temperature control and continuous flow mode, the solvent can be quickly degassed without contamination, preventing bubbles from forming in the analysis pipeline or detector, avoiding baseline drift, pressure fluctuations and detection errors.
