Solvent-volatile polymer microfluidic chips refer to microfluidic chips made of solvent-volatile polymers as substrates through specific processing techniques (such as dissolving in an appropriate solvent and then slowly volatilizing the solvent). This chip integrates a microchannel network for precise manipulation of fluids in micrometer-scale space, realizing basic operation units such as sample preparation, reaction, separation, and detection in the fields of chemistry, biology, and medicine. Solvent-volatile polymer materials, such as acrylic acid, rubber, and fluoroplastics, can be dissolved in appropriate solvents to form flowable liquids, which facilitate the formation of microchannel structures on substrates through micromachining techniques (such as photolithography, soft lithography, etc.). After the solvent evaporates, the material gradually solidifies and forms a microfluidic chip with a stable structure. These materials usually have good chemical stability and can maintain the stability of their structure and performance in a variety of chemical environments.

The global Solvent Volatile Polymer Microfluidic Chip market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
