The global Sonar Measuring Instruments market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Sonar measuring instruments are electronic devices that use the propagation characteristics of sound waves underwater to complete underwater detection, positioning and communication tasks through electroacoustic conversion and information processing. It works by utilizing the propagation characteristics of sound waves in water, which is similar to the working principle of radar in air, but the medium is different. The sonar measuring instrument consists of two parts: the transmitting transducer and the receiving transducer. The transmitting transducer is responsible for transmitting sound waves, which is equivalent to a loudspeaker in the air; the receiving transducer is responsible for receiving sound waves reflected or radiated by the target, which is equivalent to a microphone (microphone or speaker) in the air. Sonar is divided into two types: active and passive. Active sonar actively transmits sound waves and receives echoes to determine the target parameters; passive sonar mainly receives the radiated noise generated by the target or the signal emitted by the underwater acoustic equipment to determine the direction of the target.

Sonar measuring instruments are widely used in underwater target detection, classification, positioning and tracking, as well as underwater communication and navigation. They also play an important role in offshore oil exploration, ship navigation, hydrographic surveying and seabed geological and geomorphological surveying. With the rapid development of the marine economy and the in-depth implementation of the marine strategy, the demand for sonar measuring instruments will further increase. In particular, the demand for high-end military sonar systems and civilian high-precision

sonar systems will be more urgent. Synthetic aperture sonar (SAS), as a new type of high-resolution two-dimensional imaging sonar technology, is gradually attracting market attention. It has broad application prospects and the market size is constantly expanding. In the future, with the continuous maturity of technology and the expansion of application fields, synthetic aperture sonar is expected to become an important growth point in the sonar measuring instrument market. In summary, the sonar measuring instrument market shows a stable growth trend worldwide. In the future, the sonar measuring instrument market is expected to usher in a broader development prospect.
