A soot blower in a boiler is a device used to remove soot and ash deposits from the heat transfer surfaces of boilers, such as tubes and walls, to maintain their efficiency and performance. These deposits, which accumulate during combustion, can significantly reduce heat transfer and increase fuel consumption if not regularly cleaned. Soot blowers operate by using high-pressure steam, compressed air, or water to dislodge the soot and ash, ensuring optimal thermal efficiency and preventing damage or corrosion caused by prolonged buildup. They are essential in industries like power generation, where maintaining boiler performance is critical for energy production.
