The global Soy Hulls market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Soy hulls are the outer shells of soybeans that are removed during processing. They are a byproduct of the soybean industry and can be used as a feed ingredient for livestock or as a source of fiber in human food products.

Soy hulls, also known as soybean hulls, are the outer coating of soybeans that are removed during the soybean oil extraction process. These hulls are a valuable co-product in the soybean processing industry and have various applications, particularly in animal feed and agriculture. The predominant use of soy hulls has been in animal feed, particularly for ruminant animals like cattle. The fibrous and nutrient-rich nature of soy hulls makes them a popular ingredient in livestock and dairy diets. This trend was driven by the need for cost-effective and nutritionally balanced feed ingredients. The high fiber content in soy hulls is beneficial for ruminants' digestive systems. As livestock producers sought to optimize animal nutrition and digestion, the demand for soy hulls as a feed component increased. The market saw an increase in the pelletization of soy hulls for ease of handling and feeding. Pellets are easier to transport and store, and they provide a more uniform distribution in animal feed.
