The global Soybean Oil-based Printing Ink market size is predicted to grow from US\$ 294 million in 2025 to US\$ 463 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2025, global sales of soybean oil-based printing inks reached 150,000 tons, with an average selling price of US\$2,000 per ton. Soybean oil-based printing inks are environmentally friendly inks that use soybean oil as the primary solvent, replacing traditional petroleum-based solvents. They are widely used in the printing of packaging, magazines, books, and other printed materials. Compared to traditional inks, soybean oil-based inks have lower volatile organic compound (VOC) emissions, are more environmentally friendly and biodegradable, and comply with increasingly stringent environmental regulations. They exhibit excellent print quality, color vibrancy, and lightfastness, and are highly compatible with printing equipment.

The upstream raw materials for these products mainly include soybean oil, pigments, resins, and additives, while the downstream supply chain primarily serves the packaging industry, publishing and printing plants, and manufacturers of environmentally friendly packaging materials. With increasingly stringent global environmental regulations and growing demands for sustainable development, the demand for inks using plant-based solvents is constantly rising, driving the market expansion of soybean oil-based printing inks. Total production capacity is projected to be 180,000 tons per year, with a gross profit margin of approximately 20%. Downstream consumption primarily comes from the packaging and publishing industries, particularly in the food and beverage packaging sector, where demand continues to grow. Upstream material consumption is concentrated in soybean oil procurement, and production costs may be affected, especially given fluctuations in agricultural product prices.

Looking ahead, with increasing awareness of green environmental protection and the packaging industry's sustainable development goals, the market prospects for soybean oil-based printing inks are broad, especially with growing business opportunities driven by requirements for environmentally friendly packaging and low VOC emissions.

The soybean oil-based printing ink market is experiencing rapid growth, primarily driven by increased environmental awareness and global focus on sustainable development. As environmental regulations become increasingly stringent in various countries, particularly in Europe and the United States, requiring reduced volatile organic compound (VOC) emissions and the use of more environmentally friendly materials, soybean oil-based printing inks, with their low VOC emissions and biodegradable properties, have become an ideal alternative to traditional petroleum-based inks. Furthermore, with the growing demand for green packaging and sustainable printing, more and more companies are choosing soybean oil-based inks, especially in food and beverage packaging and publishing printing. These inks not only provide excellent printing results but also help companies achieve their environmental goals and reduce their environmental burden.

Additionally, with the gradual stabilization of the soybean oil supply chain and technological advancements, the cost of producing soybean oil-based printing inks is gradually decreasing, making these inks more competitive in the market. As the market penetration of soybean oil-based printing inks increases, manufacturers are continuously improving their performance, such as enhancing color vibrancy, lightfastness, and printability, leading to wider market applications. In the future, as the packaging industry transforms towards green and environmentally friendly practices and environmental regulations continue to strengthen, the market for soybean oil-based printing inks will continue to expand, especially driven by the low-carbon economy and circular economy, which will bring even more business opportunities.
