Abstracts

The global Space Debris Removal market size is predicted to grow from US\$ 298 million in 2025 to US\$ 981 million in 2032; it is expected to grow at a CAGR of 18.7% from 2026 to 2032.

Space debris removal refers to the system of technologies and services—utilizing spacecraft, robotics, capture mechanisms, laser systems, propulsion technologies, and autonomous navigation and control—designed to identify, approach, capture, relocate, de-orbit, and facilitate the atmospheric re-entry of non-functional space objects such as defunct satellites, spent rocket stages, and fragments. Space debris primarily consists of abandoned satellites, rocket remnants, explosion fragments, collision-generated debris, and micro-particles; these objects circulate in Low Earth Orbit (LEO), Medium Earth Orbit (MEO), and Geostationary Orbit (GEO), posing collision risks to active satellites, space stations, and future commercial space activities. The process typically encompasses ground-based monitoring and orbital tracking, debris risk assessment, Active Debris Removal (ADR), In-Orbit Servicing (IOS), and satellite life extension and orbital maintenance. It is a critical technological field for ensuring space security and supporting the development of satellite internet, commercial spaceflight, and deep-space exploration.

With the rapid growth of the global satellite population—particularly the swift deployment of LEO satellite constellations—the volume of space debris in near-Earth orbit continues to rise, escalating orbital congestion and collision risks. This trend is driving governments, space agencies, and commercial space enterprises to accelerate the development and deployment of space debris removal technologies. Looking ahead, as satellite launch costs decrease, reusable rockets become commonplace, and the commercial space industry expands, the need to protect orbital resources will intensify.

Space debris removal is expected to evolve from government-led research projects into commercial service models, encompassing active debris removal, satellite repair, orbital transfer, lifecycle management, and orbital cleanup missions. Major spacefaring nations—including those in Europe, the United States, and Japan—have already launched technology demonstration missions involving capture robotic arms, magnetic capture, net capture, drag sails, electrodynamic tethers, and autonomous robotics; furthermore, future regulatory requirements may mandate that new satellites possess controllable de-orbiting capabilities. Consequently, space debris removal is poised to become a vital component of future space infrastructure, fostering a market of synergistic growth alongside in-orbit servicing, space robotics, and satellite manufacturing.
