A space spectroradiometer is an instrument used to measure spectral radiation. It can measure the distribution of radiant energy emitted by a light source in different wavelength ranges to obtain spectral information of the light source. A space spectroradiometer usually consists of an optical system and a spectral measurement device. The optical system is used to collect the radiant energy emitted by the light source and focus it onto the spectrum measurement device. Spectral measurement devices can use different techniques, such as gratings, interferometers or filters, to separate the different wavelength ranges of light emitted by a light source and measure its radiated energy. Space spectral radiometers are widely used in optical research, spectral analysis, light source calibration, optical instrument testing and other fields. It

can provide important parameters such as spectral distribution, color temperature, and radiant power of the light source, which is very important for the design, calibration, and performance evaluation of optical systems.
