The satellite-borne hyperspectral imaging spectrometer is a remote sensing instrument that integrates imaging and spectral detection functions. It is carried on a satellite platform and can obtain detailed spectral information of each pixel on the earth's surface in dozens to hundreds of continuous narrow bands. It not only provides high-spatial-resolution images, but also reveals the spectral characteristics of materials, and realizes high-precision identification of the composition, structure and state of ground objects. It is widely used in precision agriculture, geological exploration, water quality monitoring and environmental change research.
