Spaceborne multibeam antennas are advanced antenna systems mounted on satellites that can generate multiple, simultaneous, and independently steerable beams to cover different regions on Earth. Unlike traditional single-beam antennas, multibeam systems divide the satellite's coverage area into multiple smaller cells or beams, allowing for more efficient frequency reuse, higher data throughput, and better service flexibility. These antennas are essential for modern satellite communication, broadcasting, navigation, and Earth observation missions, as they enable targeted, high-capacity links and dynamic resource allocation across vast geographic areas. They often use phased array or reflector-based architectures and are crucial for applications like broadband internet from space and next-generation satellite networks.
