The global Spaceborne Phased Array Antenna System market size is predicted to grow from US$ 902 million in 2025 to US$ 1958 million in 2032; it is expected to grow at a CAGR of 11.9% from 2026 to 2032.

A spaceborne phased array antenna system is an electronically steerable antenna system used on satellites that replaces or augments traditional mechanical pointing. Instead of physically moving the antenna, it uses multiple small radiating elements—each fed with precisely controlled phase and amplitude—to form and steer beams electronically in real time. This allows a single antenna to cover wide areas, track multiple targets or ground stations simultaneously, and dynamically reconfigure coverage patterns without moving parts. Phased arrays are especially valuable for modern broadband constellations, Earth observation, defense, and secure communications because they enable high capacity, low latency, multi-beam operations, and improved resilience compared with mechanical antennas. The average price is about 70K USD/Unit, and the average annual sales volume is about 12,000 units.

The upstream suppliers of spaceborne phased array antenna system include suppliers of structural and reflector materials, conductive and radiating materials, dielectrics and substrates, and semiconductor materials.

The downstream ones are: Commercial Satellite Operators, Government Space Agencies, Defense & Military Customers, Satellite Manufacturers/Integrators and Scientific & Institutional Customers, etc.
