The global Spaceborne SAR market size is predicted to grow from US\$ 2248 million in 2025 to US\$ 3404 million in 2032; it is expected to grow at a CAGR of 6.2% from 2026 to 2032.

Spaceborne synthetic aperture radar is an active microwave imaging sensor installed on space vehicles such as satellites. It uses the principle of synthetic aperture to obtain high-resolution radar images similar to optical photography under extremely low visibility meteorological conditions. Spaceborne SAR has global observation capabilities, has the characteristics of long range, all-day, all-weather, etc., and can effectively identify camouflage and penetrate cover; at the same time, by transmitting large time bandwidth product signals, such as linear frequency modulation signals, through pulse compression, obtaining high resolution in the range direction has become an important means of earth observation and has received widespread attention from various countries.

United States market for Spaceborne SAR is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Spaceborne SAR is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
