The term “Spacecraft On-Board Computer” indicates, rather obviously, any unit flying on board a satellite which provides processing capability. However, the On Board Computer, or OBC, more commonly refers to as the computer of the satellite’s avionic sub-system, i.e. the unit where the On Board Software run. In turn, the “On Board Software”, despite the rather generic label, is known as the software implementing the satellite’s vital functions such as: attitude and orbit control in both nominal and non-nominal cases, telecommands execution or dispatching, housekeeping telemetry gathering and formatting, on board time synchronisation and distribution, failure detection, isolation and recovery, etc. Based on the above, the very essence of an OBC is the microprocessor board, consisting of microprocessor, non-volatile memories, volatile memories and the companion chip that connects the microprocessor to different peripherals.
