The global Spacecraft Simulation Software market size is predicted to grow from US$ 118 million in 2025 to US$ 160 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Spacecraft simulation software is a specialized computer system used to simulate the entire process of a spacecraft's on-orbit operation. Its core is to digitally reproduce the dynamic characteristics of a spacecraft in a real space environment, the working status of each system, and the interaction relationships through high-precision mathematical models. The software integrates multidisciplinary models such as orbital dynamics, attitude control, power management, thermal control, propulsion, measurement and control communications, and incorporates environmental factors such as the space gravitational field, solar radiation, atmospheric drag, and space debris to construct a realistic virtual digital spacecraft. Its main functions include design verification, mission rehearsal, fault simulation, and operational training. It can systematically verify the correctness and reliability of the design scheme before the spacecraft is launched, expose potential problems in advance, and thus significantly reduce mission risks, shorten the development cycle, and save costs. With the development of digital twin technology, modern spacecraft simulation software has become a key tool to support the full life cycle management of spacecraft and realize the integration of "design-verification-operation".

United States market for Spacecraft Simulation Software is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
