SPDT configuration analog switches and multiplexers are used to interconnect or route analog signals between the multiple available signal paths. Functionally similar to

traditional electromechanical switches, their solid-state nature facilitates electronic control, longer lifetime, and lower switching noise compared to electromechanical switches, at the expense of increased amplitude and bias limitations of the switching signal. SPDT stands for Single Pole Double Throw and is a common switching configuration. It has a common contact and two different output contacts that can be used to switch between two different circuits.
