Speaking valves are medical devices used by individuals with tracheostomies to enable speech. When a person has a tracheostomy, a tube is inserted into their windpipe (trachea) to help them breathe, which usually prevents airflow through the vocal cords, making speech difficult or impossible. A speaking valve is a one-way valve placed on the tracheostomy tube, allowing air to enter the lungs during inhalation but directing it up through the vocal cords during exhalation, enabling the person to speak. These valves are essential for improving communication, enhancing the quality of life, and supporting better social interaction and psychological well-being for tracheostomy patients.
