The global Special Matting Powder for Leather Surface Treatment market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Matting powder for leather surface treatment is a chemical substance used in leather processing. It is mainly used to adjust the gloss of the leather surface. It is usually a fine powdery substance that can be evenly distributed on the surface of leather, reducing the gloss of leather by absorbing or scattering light, giving it a softer, low-gloss effect. Special matting powder for leather surface treatment is usually composed of some inorganic or organic particles, which can produce physical or chemical interactions with the leather surface and change the way light propagates. The particle size and shape of the matting powder can be adjusted as needed to achieve the desired matting effect. Using special matting powder for leather surface treatment can make the gloss of the leather surface more uniform, reduce the reflection of light, and reduce the brightness of the leather. This is particularly useful in some leather products that need to show a low gloss effect, such as high-end leather goods, footwear, furniture, etc. In addition, matting powder can also increase the softness and touch of leather and improve the texture of leather.
