Specialty carbon blacks are produced through partial combustion of hydrocarbons to meet rigorous specifications and deliver important functionality to plastics according to end-user performance requirements. Carbon blacks protect the polymer from UV degradation, act as a black pigment and improve the conductivity of the plastic. Carbon blacks also increase the performance of the plastic by enhancing the abrasion

resistance, modulus, tear and tensile strength. There are many types of specialty carbon blacks typically defined by their particle size and structure. These properties of carbon black enable its unique characteristics that deliver critical value to end-users through a range of functionalities including color, UV protection and conductivity. Specialty Carbons for Plastics to be applied to various markets including food, molded parts, film and sheet, wire and cable, conductivity and ESD, and pipes.

In automotive applications (interior, exterior, under-the-hood) higher retention of mechanical properties enabled by this carbon black allows for metal replacement and thinner wall molding, thus enabling formulators to meet lightweighting needs. In electrical engineering & electronics (E&E) applications, the product's delivery of high jetness at low loadings supports needs for mechanical strength, combined with good color performance as well as needs specific to electrics & electronics, comparative tracking index, glow wire ignition temperature, flame retardancy. In consumer applications, the product's high jetness characteristic enables "piano black" appearance as well as suitability for parts with needs for mechanical strength as well as chemical and heat resistance. Specialty carbon black also very well positioned to deliver excellent performance in industrial applications where a combination of high color and mechanical strength performance is needed.
