Spectral Doppler is a medical imaging technology device used to visualize and analyze blood flow in the body. It involves using pulsed ultrasound to create a spectral display of how the speed of blood flow changes over time. By sending short pulses of ultrasound into blood vessels and measuring the frequency shift of the returning waves, spectral Doppler can provide detailed information about the speed and direction of blood flow. This technique is commonly used in fields such as cardiology, obstetrics, and vascular medicine to detect abnormalities in blood circulation.

The global Spectral Doppler market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
