A spectral scintillation illuminance meter is an instrument used to measure the spectral scintillation properties of a light source. It can evaluate the stability and quality of a light source by measuring the flicker frequency and amplitude of the light emitted by the light source. Spectral scintillation illuminance meters usually consist of an optical system and a scintillation measurement device. The optical system is used to collect the radiant energy emitted by the light source and focus it onto the scintillation measurement device. Flicker measurement devices can use different technologies, such as photodiodes, photoresistors or spectrometers, to measure the flicker frequency and amplitude of light emitted by a light source. By analyzing the flicker signal, the flicker performance of the light source can be evaluated, including flicker frequency, flicker

index, and flicker duty cycle.
