The global Spectrophotometer market size is predicted to grow from US\$ 2494 million in 2025 to US\$ 2997 million in 2031; it is expected to grow at a CAGR of 3.1% from 2025 to 2031.

A spectrophotometer is an instrument that used for the measurement of transmittance or reflectance of solutions, transparent or opaque solids, such as polished glass, or gases. However they can also be designed to measure the diffusivity on any of the listed light ranges that usually cover around 200 nm - 2500 nm using different controls and calibrations.

A spectrophotometer, in general, consists of two devices; a spectrometer and a photometer. A spectrometer is a device that produces, typically disperses and measures light. A photometer indicates the photoelectric detector that measures the intensity of light.

First a collimator (lens) transmits a straight beam of light (photons) that passes through a monochromator (prism) to split it into several component wavelengths (spectrum). Then a wavelength selector (slit) transmits only the desired wavelengths. After the desired range of wavelength of light passes through the solution of a sample in cuvette, the photometer detects the amount of photons that is absorbed and then sends a signal to a galvanometer or a digital display.

The major players in global Spectrophotometer market include Agilent, Thermo Fisher, Hitachi, etc. The top 3 players occupy about 30% shares of the global market. China is the main market, and occupies about 35% shares of the global market. UV-Visible Spectrophotometer is the main type, with a share about 70%. Biotechnology is the main

application, which holds a share about 25%.
